

JNX-OS Quick Start Guide

Your JNX-OS v2 with **Qryx (Shopify AI Sales Assistant)** is **ready to use!**

What You Have

✓ Complete Authentication System

- Email/Password login and signup
- Google OAuth Sign-In (requires configuration)
- Session management with Supabase

✓ Role-Based Access Control

- Two roles: `admin` and `member`
- Admin dashboard with system health monitoring
- Protected routes with automatic redirects

✓ Beautiful UI

- JNX Dark Design System
- Responsive on all devices
- Smooth animations and transitions
- Custom scrollbar and gradients

✓ System Monitoring

- Real-time Supabase connection status
- Active sessions count
- Audit logs viewer
- User and organization management

✓ Qryx - Shopify AI Sales Assistant (Phase 3 Complete)

-  Gemini 2.0 Flash AI integration
-  Shopify OAuth & API client
-  E-commerce optimized chat system
-  Conversation tracking & analytics
-  Subscription billing ready
-  Customizable chat widget

Next Steps (5 Minutes)

Step 1: Configure Supabase

You need to set up Supabase to enable authentication and database:

1. Create a Supabase project (free):

- Go to supabase.com (<https://supabase.com>)
- Click "New Project"
- Choose a name and password
- Wait ~2 minutes for initialization

2. Get your credentials:

- In Supabase, go to **Settings > API**
- Copy these values:
 - Project URL
 - anon public key
 - service_role key

3. Add to your app:

```
bash
cd /home/ubuntu/jnx-os/nextjs_space
# Edit .env.local and paste your credentials
```

4. Run the database schema:

- In Supabase, go to **SQL Editor**
- Copy contents of `lib/db/schema.sql`
- Paste and run in SQL Editor

Step 2: Test the App

```
# App is already running on localhost:3000
# Open in browser: http://localhost:3000
```

Try these:

1. Sign up with email/password at `/signup`
2. You'll be redirected to `/app` (user dashboard)
3. Check your user was created in Supabase Table Editor

Step 3: Create an Admin User

To access the admin dashboard:

1. In Supabase, go to **Table Editor > users**
2. Find your user by email
3. Change role from member to admin
4. Log out and log back in
5. Visit `/admin` to see system health

Pages You Can Visit

Route	Description	Auth Required
/	Landing page	No
/login	Sign in	No
/signup	Create account	No
/app	User dashboard	Yes (any user)
/admin	Admin dashboard	Yes (admin only)
/privacy	Privacy policy	No
/terms	Terms of service	No
/products	Products showcase	No

Authentication Flows

Email/Password Signup

1. User enters email, password, name
2. Account created in Supabase Auth
3. Organization auto-created
4. User record created with role: `member`
5. Redirected to `/app`

Google OAuth

1. User clicks "Sign in with Google"
2. Redirected to Google OAuth
3. After approval, redirected to `/auth/callback`
4. If new user: org and user created
5. If existing: just logged in
6. Redirected to `/app`

Configuration Options

Enable Google OAuth (Optional)

See detailed instructions in [SETUP.md](#) (`./SETUP.md#google-oauth-setup`).

Quick version:

1. Create OAuth credentials in Google Cloud Console
2. Add redirect URI: `https://[your-project].supabase.co/auth/v1/callback`
3. Enable Google provider in Supabase
4. Add credentials to `.env.local`

Environment Variables

Required:

```
NEXT_PUBLIC_SUPABASE_URL=https://xxxxx.supabase.co
NEXT_PUBLIC_SUPABASE_ANON_KEY=eyJhb...
SUPABASE_SERVICE_ROLE_KEY=eyJhb...
NEXT_PUBLIC_APP_URL=http://localhost:3000
```

Optional (for Google OAuth):

```
NEXT_PUBLIC_GOOGLE_CLIENT_ID=xxx.apps.googleusercontent.com
NEXT_PUBLIC_GOOGLE_CLIENT_SECRET=xxx
```

Troubleshooting

App shows “Supabase not configured”

→ Add your Supabase credentials to `.env.local` and restart dev server

Can’t access /admin

→ Update your user’s role to `admin` in Supabase Table Editor

Google OAuth not working

→ Check redirect URIs are correct in Google Cloud Console

Database errors

→ Make sure you ran the `schema.sql` in Supabase SQL Editor

Full Documentation

- [README.md](#) (`./README.md`) - Complete project overview
- [SETUP.md](#) (`./SETUP.md`) - Detailed setup instructions
- **Database Schema** - See `lib/db/schema.sql`

Design System

The app uses **JNX Dark** design system:

- Background: `#030712` (deep slate)
- Primary: `#06b6d4` (cyan)
- Fonts: Inter (body), JetBrains Mono (code)
- Components in `components/ui/`

Deploy to Production

When ready to deploy:

1. Push code to GitHub
2. Import project in [Vercel](https://vercel.com) (<https://vercel.com>)
3. Add all environment variables

4. Update `NEXT_PUBLIC_APP_URL` to production domain

5. Deploy!

Important: Update Google OAuth redirect URIs to include your production domain.

🌟 What's Working

- ✓ Landing page with hero and features
- ✓ Authentication (email/password + Google OAuth ready)
- ✓ User dashboard with stats
- ✓ Admin dashboard with system health
- ✓ Route protection (middleware)
- ✓ Audit logging
- ✓ GDPR-compliant privacy policy
- ✓ Responsive design
- ✓ Custom scrollbar and animations

🌐 Next Phase Features (Roadmap)

Phase 2 will add:

- Stripe billing integration
- Subscription management
- Team/organization management
- Usage tracking

Phase 3 will add:

- QRYX product (AI Sales Assistant)
- Multi-product architecture
- Advanced analytics
